

## Conceal Unsightly Wires With ICM's High Density Wall Plates

*The splitter and high density wall plates are designed with a protective cover to safeguard wires and allow for quick and easy installation.*

ICM Corp.'s Home Integration Products (HIP) feature splitter and high density wall plates offering professional installers a great solution to create quick and easy installations when an abundance of wires are an issue.

The screw in wall plate and effortless snap-on cover provide strong protection from wires being bumped or struck after installation. The protective cover also ensures that cables will not exceed cable bend radius and defends against the breaking of F-81 connectors. A perfect solution for all home theater systems.

The splitter wall plates are specifically designed with two easy punch-out holes located on the bottom of the snap-on cover to accept and conceal a two-way splitter, or two F-81 connectors.

The high density wall plates allow for multiple wires to run through the plate and into the room concealed and unnoticed without a jack.

The Splitter and High Density Wall Plates color match with other ICM Corp. HIP wall plates to ensure consistency in color quality. The HIP wall plates range from single port to six port and are available in keystone and decora style sets.

ICM Corp. designs and manufactures these great products in our own facilities to guarantee our customers are receiving high-quality, superior performance products.
